1. Preliminaries

Definition 1.1 (Hovey Definition 2.1.1). Suppose \mathcal{C} is a cocomplete category, and λ is an ordinal. A λ -sequence in \mathcal{C} is a colimit-preserving functor $X:\lambda\to\mathcal{C}$, commonly written as

$$X_0 \to X_1 \to \cdots \to X_\beta \to \cdots$$
.

Since X preserves colimits, for all limit ordinals $\gamma < \lambda$, the induced map

$$\operatorname{colim}_{\beta < \lambda} X_{\beta} \to X_{\gamma}$$

is an isomorphism. We refer to the map $X_0 \to \operatorname{colim}_{\beta < \lambda} X_{\beta}$ as the *composition* of the λ -sequence. Given a collection \mathcal{D} of morphisms in \mathcal{C} such that every map $X_{\beta} \to X_{\beta+1}$ for $\beta+1 < \lambda$ is in \mathcal{D} , we refer to the composition $X_0 \to \operatorname{colim}_{\beta < \lambda} X_{\beta}$ as a *transfinite composition* of maps in \mathcal{D} .

Definition 1.2 (Hovey Definition 2.1.2). Let γ be a cardinal. An ordinal α is γ -filtered if it is a limit ordinal and, if $A \subseteq \alpha$ and $|A| \le \gamma$, then $\sup A < \alpha$.

Definition 1.3 (Hovey Definition 2.1.3). Suppose \mathcal{C} is a comcomplete category, $\mathcal{D} \subseteq \mathrm{Mor}\,\mathcal{C}$ is some collection of morphisms of \mathcal{C} , A is an object of \mathcal{C} , and κ is a cardinal. We say that A is κ -small relative to \mathcal{D} if, for all κ -filtered ordinals λ and all λ -sequences

$$X_0 \to X_1 \to \cdots \to X_\beta \to \cdots$$

such that each map $X_{\beta} \to X_{\beta+1}$ is in \mathcal{D} for $\beta+1 < \lambda$, the map of sets

$$\operatorname{colim}_{\beta < \lambda} \mathcal{C}(A, X_{\beta}) \to \mathcal{C}(A, \operatorname{colim}_{\beta < \lambda} X_{\beta})$$

is an isomorphism. We say that A is *small relative to* \mathcal{D} if it is κ -small relative to \mathcal{D} for some κ . We say that A is *small* if it is small relative to \mathcal{C} itself.

Definition 1.4 (Hovey Definition 2.1.7). Let I be a class of maps in a category \mathfrak{C} .

- (1) A map is *I-injective* if it has the right lifting property w.r.t. every map in *I*. The class of *I*-injective maps is denoted *I*-inj (or I_{\perp}).
- (2) A map is *I-projective* if it has the left lifting property w.r.t. every map in *I*. The class of *I*-projective maps is denoted *I*-proj (or $_{\perp}I$).
- (3) A map is an *I-cofibration* if it has the left lifting property w.r.t. every *I*-injective map. The class of *I*-cofibrations is the class (*I*-inj)-proj and is denoted *I*-cof (or $_{\perp}(I_{\perp})$).
- (4) A map is an *I-fibration* if it has the right lifting property w.r.t. every *I*-projective map. The class of *I*-fibrations is the class (*I*-proj)-inj and is denoted *I*-fib (or $(\bot I)_{\bot}$).

Definition 1.5 (Hovey Definition 2.1.9). Let I be a set of maps in a cocomplete category \mathcal{C} . A relative I-cell complex is a transfinite composition of pushouts of elements of I. That is, if $f: A \to B$ is a relative

Date: January 27, 2023.

I-cell complex, then there is an ordinal λ and a λ -sequence $X : \lambda \to \mathcal{C}$ such that f is the composition of X and such that, for each β such that $\beta + 1 < \lambda$, there is a pushout square

$$\begin{array}{ccc}
C_{\beta} & \longrightarrow & X_{\beta} \\
g_{\beta} \downarrow & & \downarrow \\
D_{\beta} & \longrightarrow & X_{\beta+1}
\end{array}$$

with $g_{\beta} \in I$. We denote the collection of relative *I*-cell complexes by *I*-cell. We say that $A \in \mathcal{C}$ is an *I*-cell complex if the map $0 \to A$ is a relative *I*-cell complex.

Lemma 1.6 (Hovey 2.1.10). Suppose I is a class of maps in a category \mathbb{C} with all small colimits. Then $I\text{-cell} \subseteq I\text{-cof}$.

Definition 1.7 (Hovey Definition 2.1.17). Suppose \mathcal{C} is a model category. We say that \mathcal{C} is *cofibrantly generated* if there are sets I and J of maps such that:

- 1. The domains of the maps of I are small relative to I-cell;
- 2. The domains of the maps of J are small relative to J-cell;
- 3. The class of fibrations is J-inj; and
- 4. The class of trivial fibrations is I-inj.

We refer to I as the set of generating cofibrations and to J as the set of generating trivial cofibrations. A cofibrantly generated model category is finitely generated if we can choose the sets I and J above so that the domains and codomains of I and J are finite relative to I-cell.

Proposition 1.8 (Hovey Proposition 2.1.18). Suppose \mathfrak{C} is a cofibrantly generated model category, with generating cofibrations I and generating trivial fibrations J.

- (a) The cofibrations form the class I-cof.
- (b) Every cofibration is a retract of a relative I-cell complex.
- (c) The domains of I are small relative to the cofibrations.
- (d) The trivial cofibrations form the class J-cof.
- (e) Every trivial cofibration is a retract of a relative J-cell complex.
- (f) The domains of J are small relative to the trivial cofibrations.

If C is fibrantly generated, then the domains and codomains of I and J are finite relative to the cofibrations.

Proof. TODO.

Theorem 1.9 (Hovey Theorem 2.1.19). Suppose \mathbb{C} is a complete \mathcal{E} cocomplete category. Suppose \mathbb{W} is a subcategory of \mathbb{C} , and I and J are sets of maps of \mathbb{C} . Then there is a cofibrantly generated model structure on \mathbb{C} with I as the set of generating cofibrations, J as the set of generating trivial fibrations, and \mathbb{W} as the subcategory of weak equivalences if and only if the following conditions are satisfied.

- 1. The subcategory W has the 2-of-3 property and is closed under retracts.
- 2. The domains of I are small relative to I-cell.
- 3. The domains of J are small relative to J-cell.
- 4. J-cell $\subseteq W \cap I$ -cof.
- 5. I-inj $\subseteq W \cap J$ -inj.
- 6. Either $W \cap I$ -cof $\subseteq J$ -cof or $W \cap J$ -inj $\subseteq I$ -inj.

Proof. TODO.

Definition 1.10. Let \mathcal{C} be a category and I a collection of morphisms in \mathcal{C} . Then if I is closed under transfinite composition, pushouts, and retracts then we say I is saturated.

2. Topological Spaces

An injective map $f: X \to Y$ in **Top** is an *inclusion* if U is open in X if and only if there is a V open in Y such that $f^{-1}(V) = U$. If f is a closed inclusion and every point in $Y \setminus f(X)$ is closed, then we call f a closed T_1 inclusion. We will let \mathcal{T} denote the class of closed T_1 inclusions in **Top**.

The symbol D^n will denote the unit disk in \mathbb{R}^n , and the symbol S^{n-1} will denote the unit sphere in \mathbb{R}^n , so that we have the boundary inclusions $S^{n-1} \hookrightarrow D^n$. In particular, for n = 0 we let $D^0 = \{0\}$ and $S^{-1} = \emptyset$.

Definition 2.1. A map $f: X \to Y$ in **Top** is called a *weak equivalence* if

$$\pi_n(f,x):\pi_n(X,x)\to\pi_n(Y,f(x))$$

is an isomorphism for all $n \geq 0$ and for all $x \in X$. We will write \mathcal{W} to refer to the class of all weak equivalences in **Top**.

Define the set of maps I' to consist of all the boundary inclusion $S^{n-1} \hookrightarrow D^n$ for all $n \geq 0$, and define the set J to consist of all the inclusions $D^n \hookrightarrow D^n \times I$ mapping $x \mapsto (x,0)$ for $n \geq 0$. Then a map f will be called a *cofibration* if it is in I'-cof = $_{\perp}(I'_{\perp})$, and a *fibration* if it is in J-inj = J_{\perp} .

A map in I'-cell is usually called a relative cell complex; a relative CW-complex is a special case of a relative cell complex, where, in particular, the cells can be attached in order of their dimension. Note that in particular maps of J are relative CW complexes, hence are relative I-cell complexes. A fibration is often known as a Serre fibration in the literature.

Theorem 2.2 (Hovey Theorem 2.4.19). There is a finitely generated model structure on **Top** with I' as the set of generating cofibrations, J as the set of generating trivial cofibrations, and the cofibrations, fibrations, and weak equivalences as above. Every object of **Top** is fibrant, and the cofibrant objects are retracts of relative cell complexes.

Proof. We will apply Theorem 1.9 to get that there is a cofibrantly generated model structure on **Top** with I' as the set of generating cofibrations, J as the set of generating trivial fibrations, and W as the subcategory of weak equivalences. The six requirements outlined in the theorem will be verified like so:

- 1. W is a subcategory of C which has the 2-of-3 property and is closed under retracts: Lemma 2.6.
- 2. The domains of I' are small relative to I'-cell: In Lemma 2.3, we will show that every space is small relative to the inclusions, and in particular every space is small relative to the class \mathcal{T} of closed T_1 inclusions. Hence, it will suffice to show that I'-cell $\subseteq \mathcal{T}$. In Proposition 2.5, we will show that \mathcal{T} is saturated, and clearly every map in I' is a closed T_1 inclusion, so the desired result follows.
- 3. The domains of J are small relative to J-cell: By the same argument given above, this will follow by Lemma 2.3, Proposition 2.5, and the fact that $J \subseteq \mathcal{T}$.
- 4. J-cell $\subseteq W \cap I'$ -cof: In Proposition 2.7, we will show J-cof $\subseteq W \cap I'$ -cof, and by Lemma 1.6 J-cell $\subseteq J$ -cof.
- 5. I'-inj $\subseteq W \cap J$ -inj: Proposition 2.8
- 6. $W \cap J$ -inj $\subseteq I'$ -inj: Proposition 2.9

It will follow by the definition of a cofibrantly generated model structure (Definition 1.7) that the fibrations in this model structure are given by J-inj, which is precisely how we defined it. By Proposition 1.8, the class of cofibrations will be given by I'-cof, which is likewise exactly how we defined them.

In Proposition 2.4, we will show that compact spaces are finite relative to the class \mathcal{T} of closed T_1 inclusions. Hence, this model structure will be finitely generated, as the domains and codomains of I' and J are all compact, and by the reasoning given above we will have shown I'-cell $\subseteq \mathcal{T}$.

We will show that every object of **Top** is fibrant in Corollary 2.10. Finally, to see that cofibrant objects are retracts of relative cell complexes, FINISH

Lemma 2.3 (Hovey 2.4.1). Every topological space is small relative to the inclusions.

Proof. TODO.

Proposition 2.4 (Hovey 2.4.2). Compact topological spaces are finite relative to the class \mathfrak{T} of closed T_1 inclusions.

Proof. TODO.

Proposition 2.5 (Hovey 2.4.5 & 2.4.6). The class of closed T_1 inclusions is saturated.

Proof. TODO.

Lemma 2.6 (Hovey Lemma 2.4.4). The weak equivalences in **Top** are closed under retracts and satisfy 2-of-3 axiom (so that in particular the weak equivalences form a subcategory, as clearly identities are weak equivalences).

Proof. First we show that weak equivalences satisfy 2-of-3. Let $f: X \to Y$ and $g: Y \to Z$ be continuous functions of topological spaces.

First of all, suppose f and g are both weak equivalences. Then by functoriality of π_n , since $\pi_n(f,x)$ and $\pi_n(g,f(x))$ are isomorphisms for all $x \in X$, $\pi_n(g \circ f,x) = \pi_n(g,f(x)) \circ \pi_n(f,x)$ is likewise an isomorphism for all $x \in X$, so that $g \circ f$ is a weak equivalence.

Now, suppose that $g \circ f$ and g are weak equivalences. Pick a point $x \in X$. We wish to show that $\pi_n(f,x): \pi_n(X,x) \to \pi_n(Y,f(x))$ is an isomorphism for all $n \geq 0$. We know that $\pi_n(g \circ f,x)$ is an isomorphism, and $\pi_n(g,f(x))$ is an isomorphism, say with inverse, φ , so that

$$\varphi \circ \pi_n(g \circ f, x) = \varphi \circ \pi_n(g, f(x)) \circ \pi_n(f, x) = \pi_n(f, x)$$

is an isomorphism, as it is a composition of isomorphisms.

Now, suppose that $g \circ f$ and f are weak equivalences. Pick a point $y \in Y$. Since $\pi_0(f)$ is an isomorphism, there exists a point $x \in X$ such that f(x) belongs to the path component containing y, so that there exists some $\alpha: I \to Y$ with $\alpha(0) = f(x)$ and $\alpha(1) = f(y)$. Then consider the following diagram

$$\pi_n(Y,y) \xrightarrow{\pi_n(g,y)} \pi_n(Z,g(y))$$

$$\downarrow \qquad \qquad \downarrow$$

$$\pi_n(Y,f(x)) \xrightarrow{\pi_n(g,f(x))} \pi_n(Z,g(f(x)))$$

where the left arrow is the isomorphism given by conjugation by the path α , and the right arrow is the isomorphism given by conjugation by the path $g \circ \alpha$. It is tedious yet straightforward to verify that the diagram commutes. Furthermore, we know that $\pi_n(f,x)$ and $\pi_n(g \circ f,x) = \pi_n(g,f(x)) \circ \pi_n(f,x)$ are isomorphisms for all n, so that if we denote the inverse of $\pi_n(f,x)$ by φ , then

$$\pi_n(g \circ f, x) \circ \varphi = \pi_n(g, f(x)) \circ \pi_n(f, x) \circ \varphi = \pi_n(g, f(x))$$

is an isomorphism, as it is given as a composition of isomorphisms. Hence, the top arrow must likewise be an isomorphism, precisely the desired result.

The fact that weak equivalences in **Top** are closed under retracts is entirely straightforward and follows from the fact that the functors π_n preserve retract diagrams and that the class of isomorphisms in any category is closed under retracts.

Proposition 2.7 (Hovey 2.4.9). J-cof $\subseteq W \cap I'$ -cof.

$$Proof.$$
 TODO.

Proposition 2.8 (Hovey 2.4.10). I'-inj $\subseteq W \cap J$ -inj

$$Proof.$$
 TODO.

Proposition 2.9 (Hovey 2.4.12). $W \cap J$ -inj $\subseteq I'$ -inj

Corollary 2.10 (Hovey 2.4.14). Every topological space is fibrant, i.e., given a space X, the unique map $X \to *$ is an element of J-inj.

$$Proof.$$
 TODO.

Questions:

(1) What is an example of a relative cell complex that is not a CW complex?
